

VELES

从零升始教你搭建Linux主节

Veles: 从零开始教你搭建 Linux 主节

点

描述:

该教程将教您一一步一一步搭建基于 Linux 系统的 Veles 主节点。可以使用用 Veles 主节点安装工工具实现服器器端的快速安装。地址: https://github.com/Velescore/veles-masternode-install 如果您需要帮助,可以在 discord 社区联系我们: https://discord.gg/P528fGg

主节点系统支支持:

- Ubuntu
- Debian
- Linux Mint
- Gentoo
- Sabayon
- Fedora
- RHEL
- CentOS

搭建要求:

- 2000 VLS 代币
- Linux VPS(在后续指引中会介绍)
- 本地 Veles 钱包
- SSH 客户端 (本教程以 BitVise 为例例)

主要内容:

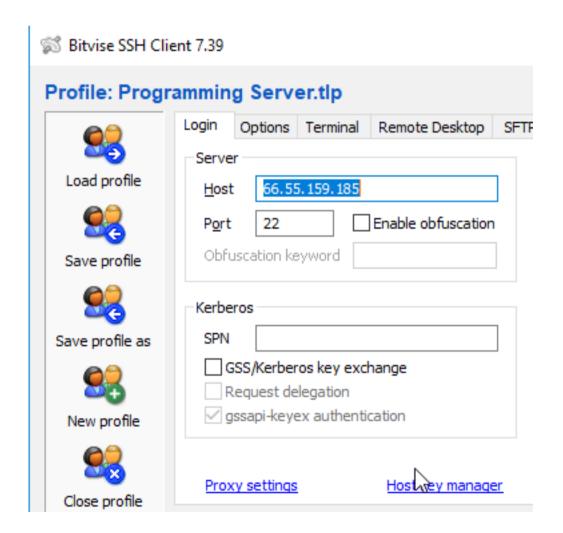

- 1: 在本地电脑下载并安装 SSH 客户端
- 2: 使用用 SSH 客户端连接 VPS 并安装主节点安装器器脚本
- 3: 在本地电脑下载并准备本地钱包
- 4:连接并启动主节点

开始:

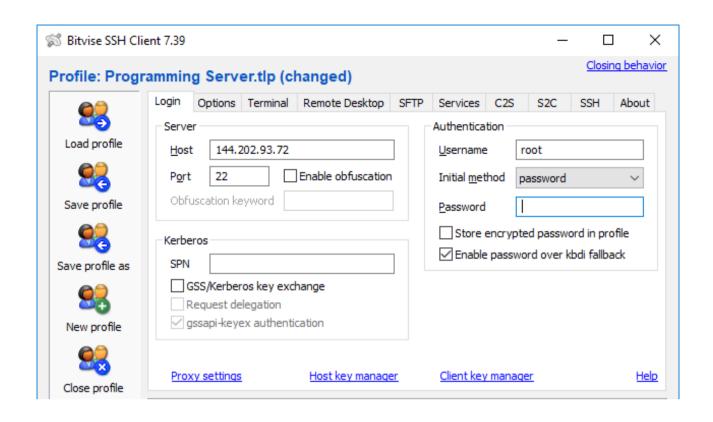

- 1、在本地电脑下载并安装SSH客户端
 - (1) 下载BitVise客户端 (https://dl.bitvise.com/BvSshClient-Inst.exe)
- 2、使用BitVise连接VPS并安装主节点脚本

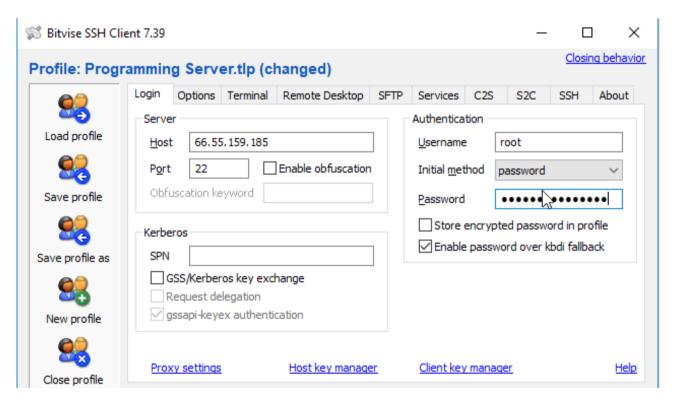

注意: VPS推荐使用Vultr提供的美国主机。购买指引请自行搜索,网络有很多教程。

(1)打开BitVise应用,在HOST栏填写VPS的主机IP(购买后,在Vultr控制台可以看到IP和登录密码)。如下图

(2) 粘贴密码到BitVise应用的Password一栏中,用户名填写root,如下图:

完成后连接主机。

- (3) 连接后会弹出安全警告,点击yes即可。
- (4) 当弹出命令行界面后,输入以下命令后点击回车等待:

source <(curl -s https://raw.githubusercontent.com/velescore/veles-installer/master/masternode.sh)

```
oot@instance-1:~# source <(curl -s https://raw.githubusercontent.com/velescore/veles-installer/master/masternode.sh
 Checking whether Veles Core is already installed ... no
 Starting Veles Core installation...
   Checking dependencies ...
Downloading installation archive ...
                                                                                      ok
   Setting up user account ...
Creating new user account veles ...
                                                                                      ok
ok
   Creating new datadir ...
Checking whether UFW firewall is present ... no
    Generating configuration file ...
                                                                                      ok
    Creating systemd service veles ...
                                                                                      ok
    Reloading systemctl ..
                                                                                      ok
    Setting up the service to auto-start on system boot
                                                                                      ok
```

(5) 在提示输入主节点私钥时,直接点击回车,让系统自动生成私钥即可。

```
Checking whether Veles Core is already installed ... no
  Starting Veles Core installation...
    Checking dependencies ...
Downloading installation archive ...
    Setting up user account ...
Creating new user account veles ...
                                                                                          ok
    Creating new datadir ...
Checking whether UFW firewall is present ... no
     Generating configuration file ...
                                                                                          ok
     Creating systemd service veles ...
                                                                                          ok
     Reloading systemctl ...
Setting up the service to auto-start on system boot ...
                                                                                          ok
                                                                                          ok
bash: [: ==: unary operator expected
                        ernode Private Key. Leave it blank to generate a new Masternode Private Key for you:
nter your veles
```

安装完成后,屏幕会弹出所生成的私钥,复制粘贴下来,后面会用到。

```
* Done.

Veles Core Daemon version v0.17.1.1-6efe42a5c "Aged Amnesia"

Veles Core Masternode is up and running listening on port 21337.

Configuration file is: /home/veles/.veles/veles.conf

VPS_IP:PORT 35.240.96.108:21337

MASTERNODE PRIVATEKEY is: 87MXp6uiSRjUYiZkBo8bAPNNeKlddECpBguxEnGEBQc3UHthm1R

Start: systemctl start veles.service

Stop: systemctl stop veles.service

You can always check whether veles daemon is running

with the following command: systemctl status veles.service

Use veles-cli masternode status to check your MN.

For help join discord https://discord.gg/P528fGg ...

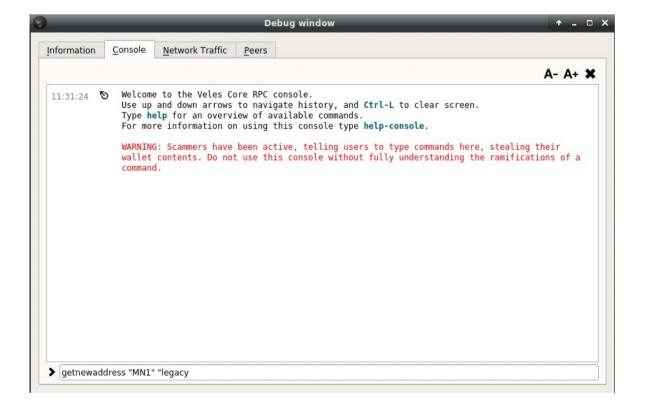

Congratulations, Veles Core has been installed successfuly.
```

3、准备本地钱包

- (1) 在此链接下载本地钱包: https://www.veles.network/download.html 注意: 确保本地钱包有2000个VLS,注意资金要稍多于2000VLS,因为在给自己转币时,需要付小额手续费。转给自己的2000个VLS用于节点质押,不能多也不能少。
 - (2) 在本地钱包控制台(Debug Console)可以使用命令:

getnewaddress "" "legacy"

生成自己的收币地址。也可以在本地钱包的接受栏生成收币地址。

- (3) 将2000VLS不多不少的发送到自己的收币地址。
- (4) 待交易确认16个区块以上后,再进入控制台,并输入命令:

masternode outputs

复制并记下输出结果,以备后续步骤使用。

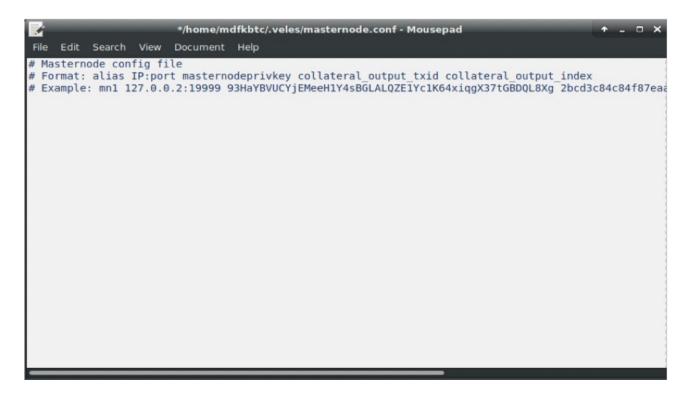

4、连接并启动主节点

- (1) 点击本地钱包的Tools菜单,再点击"open masternode configuration file"一栏
- (2) 填写主节点配置文件,

格式: mn1 IP:PORT masternodeprivkey TXid output_id

- mn1是主节点名称,可随意命名,但不可留空
- IP:PORT是VPS的IP地址,PORT端又填写21337
- masternodeprivkey填写在VPS安装节点时记下的主节点私钥
- TXid填写Outputs的输出值,很长的那串字符
- output id填写Outputs输出值,0或者1的数字

主节点配置文件中有实例,可以参考填写。如下图:

- (3) 在菜单栏各条目中找到开启主节点界面的选项,开启后重新启动钱包。
- (4) 钱包重启后,即会出现主节点界面,进入界面后便可看见刚才配置好的节点。
- (5) 点击start all 启动所有节点。

- (6) 再次使用BitVise连接VPS
- (7) 依次使用以下命令杳看主节点状态:

su veles veles-cli masternode status

常用用命令:

Veles 用用户命令:

- su veles # 将根用用户切换为 veles
- veles-cli masternode status # 查看主节点状态
- veles-cli getblockchaininfo # 检查主节点信息和区块数
- veles-cli mnsync status # 检查主节点状态

根用用户命令:

- systemctl status veles.service # 检查 Veles 服务状态
- systemctl start veles.service # 启动 Veles 服务
- systemctl restart veles.service # 重启 Veles 服务
- systemctl stop veles.service # 停止止 Veles 服务

Congratulations, Veles Core has been installed successfuly.
